Question No.: 2 ( Marks: 1 )

If Num is an integer variable then Num++ means,

Add 1 two times with Num

**Add 1 with Num**

Add 2 with Num

Subtract 2 from Num

Question No.: 3 ( Marks: 1 )

For one byte there are \_\_\_\_\_ combinations of values that can be stored in computer.

$2^6$

$2^7$

**$2^8$**

$2^4$

Each bit is capable of holding two possible values, the number of possible different combinations of

values that can be stored in n bits is  $2^n$ . For example:

1 bit can hold  $2 = 2^1 = 2$  possible values (0 or 1)

2 bits can hold  $2 \times 2 = 2^2 = 4$  possible values

so 8 bits(one byte) =  $2^8 = 256$

We can not copy array directly in this way (arr2=arr1;)

Each member of arr1 to be copied by each member of arr2.

We can use for loop to copy array 1 to array2

Question No: 23 ( Marks: 5 )

**Differentiate between random access and sequential access file?**

**Random access file:**

Random access files are not in sequence mean its not necessary put that's thing first that written first we put any thing from file any where. So tellg() and tellp() are the two very useful functions while reading from or writing into the files at some certain position.

**Sequential access file:**

Sequential access files are simple character files. while working with the sequential access files we write in a sequence not in a random manner
